Deliver
Power For Better Life

 Before installing and using this product, please read this manual carefully and pay more attention to safety.

Main application

As a new-style aerogenous indoor high-voltage load switch, this FN7-12DR AC high-voltage load switch (hereafter referred to as load switch) applies to 3-phase AC electric system with 50Hz frequency and 12kV rated voltage and acts as the ON/OFF of load current and closing of short circuit current.

Main application

FN 7 - 12 D □ □ R □ □ / □ □ □

Working conditions

Ambient temperature: -25 °C~+40°C

Altitude: within 1000m

Relative humidity: no more than 95% for daily average, and no more than 90% for monthly average.

No corrosive or flammable gas as well as water vapor around

No frequent sharp-shake

Main technical specifications

See List 1 for main specifications

See List 2 for rated parameters

See List 3 for rated parameters of fuse

Structure description

The load switch consists of base、 insulators、 moving/fixed contact、 arcing contact、 arc extinguishing contact and chamber、 driving mechanism、 spring operating mechanism、 fuse and CS6 or disc operating mechanism and so on, in addition, it is available to be combined with groundswitch, and the interlocking device is equipped as well.

Functions

Closing operation: when under manual closing mode, the operating mechanism make the spring be compressed through driving mechanism, then the released spring makes the knife contact close quickly when the spring has been compressed to be a certain degree.

Opening operation and arcing extinguishing principle: when under manual opening mode, the released spring makes the major knife contact open firstly, then arcing knife contact opens the circuit instantaneously. During the opening of arcing knife contact, the arc is generated, at the same time, the arc extinguishing chamber cools down the arc and generate gas under the motivation of electric arc to make the arc extinguish.

For the load switch equipped with impact fuse, when the fuse is burnt out, but there still be some phase line(s), the load switch will open automatically, if want to reclose, fasten the trip device.

For the load switch with groundswitch, the interlocking can be acquired through interlocking mechanism so that the opening or closing by mistaking can be avoided effectively.

If the fuse selected can not match the integrated load switch, it is available to use split type load switch.

For the load switch equipped with automatic trip device, available to be equipped with electric opening device additionally to acquire electric opening.

Overall dimension and installation

See Fig 1-12 for overall dimensions, and for the installation method of CS6 or disc operating mechanism, please refer to Fig 15-19.

If under double power supply modes, please refer to Fig 13-14 for the anti-mislocking control of the two switches.

For the load switch equipped with electric opening device, refer to Fig20 for the electric schematic diagram.

Installation and debugging

Before leave factory, all the products have been inspected completely,so any attempt to regulate or operate these switches isnot permissible.

Generally, only vertical wall or metal frame is allowable to install this load switch, and use 4-6 M12 bolts to fasten it at the mounting holes.

After connect switch bus and copper bars, fasten it with bolts, in addition, all the operations should be implemented softly in case cause damage or distortion to switch so that the conductive performance and contacting effect can be influenced.

If equipped with CS6 type or disc operating mechanism, it is under closing mode when the handle goes upwards, conversely, it is under opening mode.

After the installation of operating mechanisms and bus of load switch, a 5 times opening/closing operations at least should be carried out to check if the moving parts can be rotated flexibly, also check if the contact is under good condition and check if there is misplacement for the moving and fixed contacts due to the installation of bus.

Operation and maintenance

After unpacking, check if the products are completed as the packing list, and check if there is any damage caused in the course of transportation or safekeeping.

Remove the dust on product and clean the insulators as well as grounding position

After installation, check if the connection is correct and if the ground wire has been connected reliably.

When under running mode, carry out inspection and maintenance regularly, one time each year at least. After 20 times opening, it is strongly recommended to carry out inspection completely.

Before carry out maintenance, must cut off the power supply, at the same time, check the contact state of insulators and contact terminals.

Only the personal familiar with the performance、 structure as well as the installation method of this product is allowable to operate this switch.

Operation instruction for FN7-12CDXLRA program lock

- Before leave factory, both of the two switches are under the mode that the major knife- contact is opening and the ground knife-contact is closed, also the program lock has been locked, and the common key is placed separately; in addition, equipped with exclusive handle for program lock.
- After install the switch, take out the key to open program lock of one switch to close the load switch, however, do not pull out the key at this time (forbidden to pull out the key forcibly in case cause damage to interlocking mechanism), otherwise, it will be failed to close the other switch.
- If it needs to close the other switch, must open the first switch and lock the program lock, take out the key and open the program lock of the other switch so that the other switch can be closed.
- The opening/closing operation should be carried out as the following procedure:
Closing operation of load switch:
1, Close the door of electric cabinet
2, Open the grounding knife-contact
3, Close the load switch
4, Do not pull out the key of program lock
Operation procedure for opening switch
1, Open the load switch
2, Close the grounding knife contact
3, Take out the key of program lock
4, Open the door
- Please keep the key of lock properly in case lost.

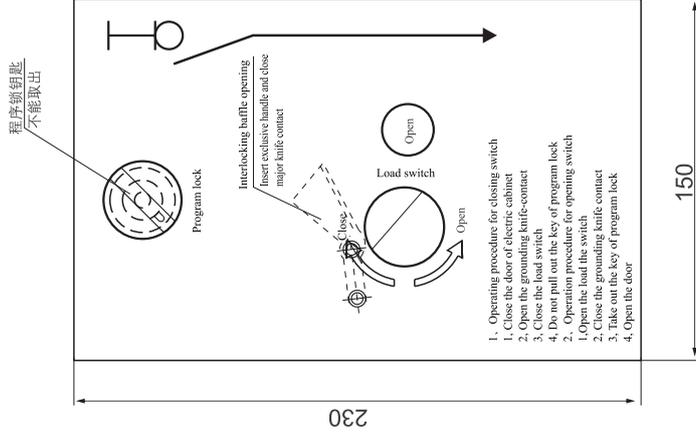

(The hole size between the ordinary panel of C type combined switch and panel with program lock is the same, see above Fig for details)

● Operation instruction for FN7-12C (R) program lock

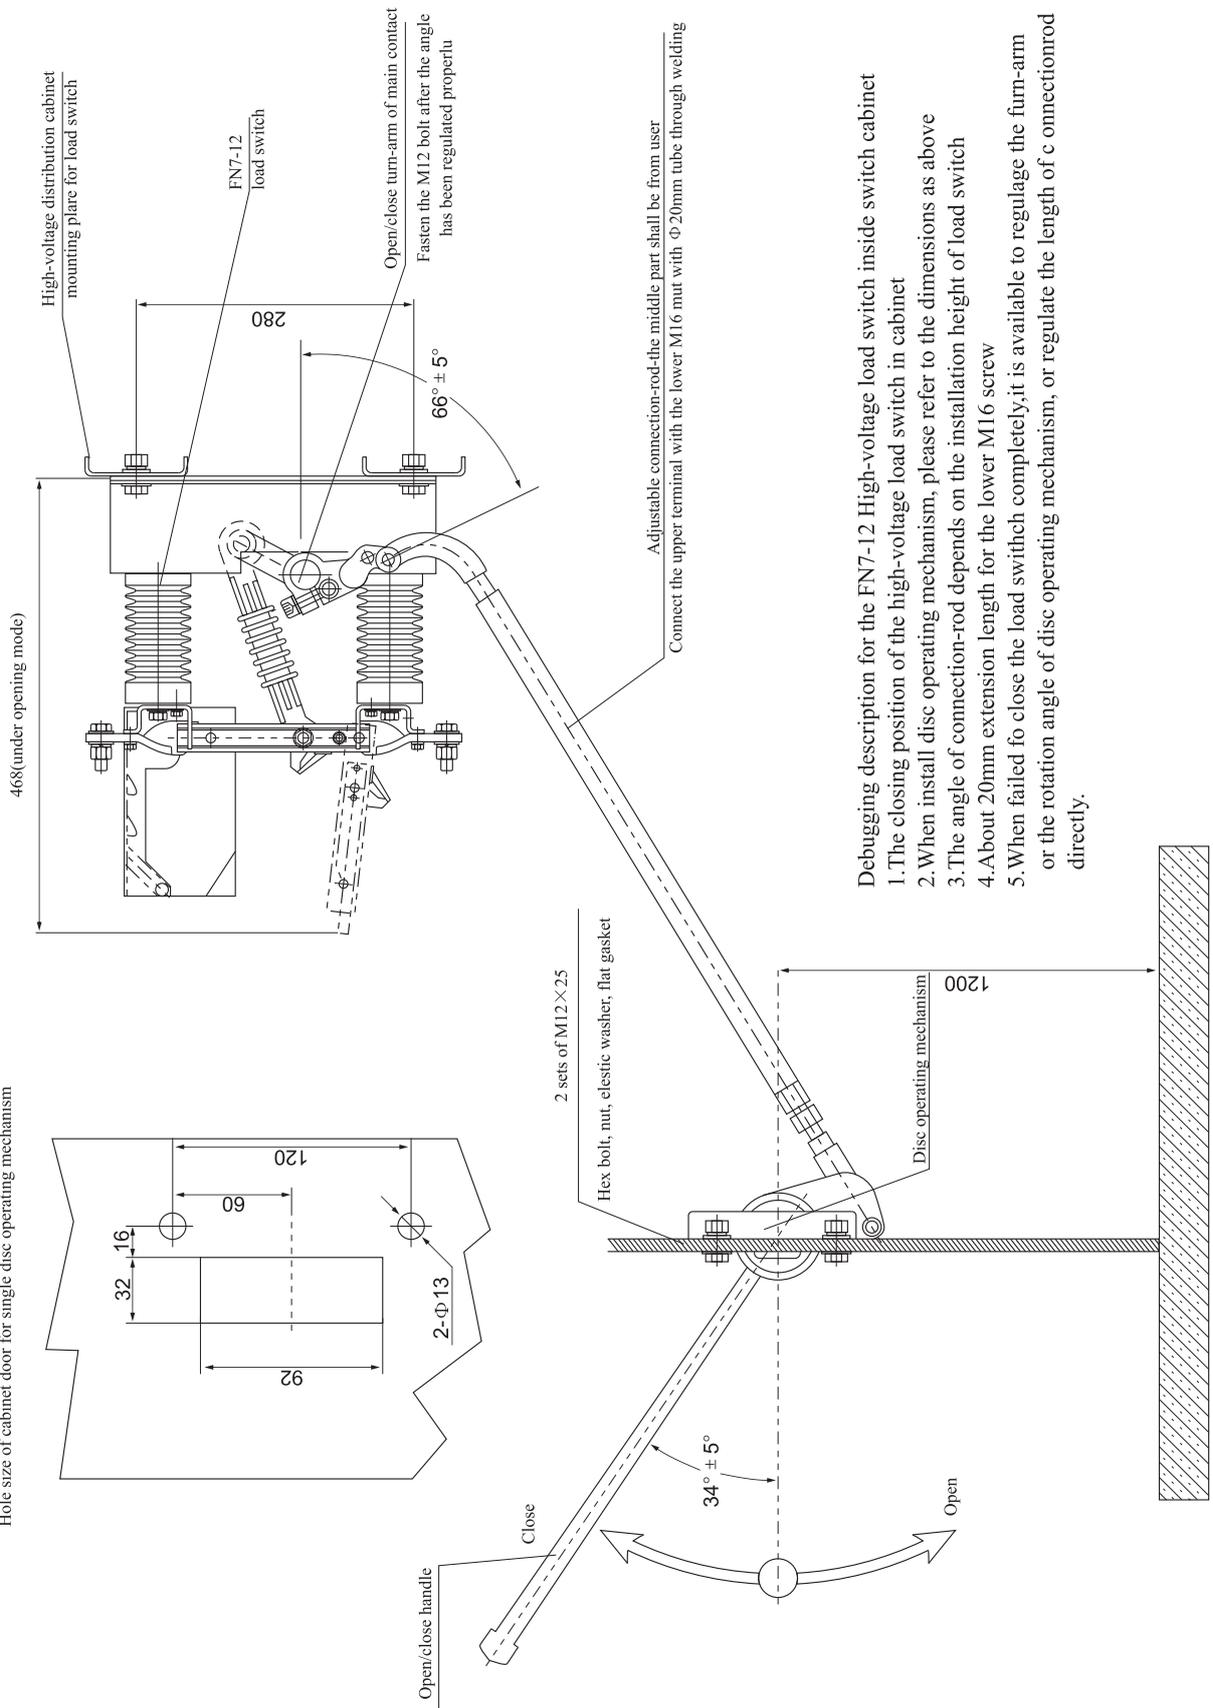

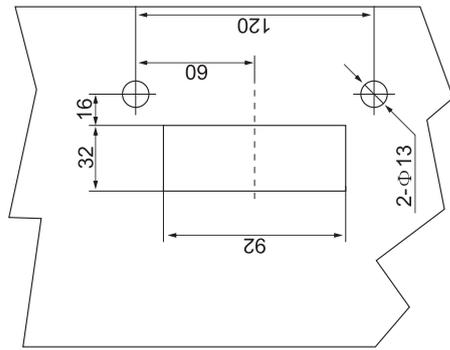

- Before leave factory, both of the two switches are under the closing mode so that the transportation becomes easier, also the program lock has been locked, and the common key is placed separately; in addition, equipped with exclusive handle for program lock.
- After install the switch, take out the key to open program lock of one switch to close the load switch, however, do not pull out the key at this time (forbidden to pull out the key forcibly in case cause damage to interlocking mechanism), otherwise, it will be failed to close the other switch.
- If it needs to close the other switch, must open the first switch and lock the program lock, take out the key and open the program lock of the other switch so that the other switch can be closed.
- The opening/closing operation should be carried out as the following procedure:
- Closing operation of load switch:
 - 1, Close the door of electric cabinet
 - 2, Close the load switch
 - 3, Do not pull out the key of program lock
- Operation procedure for opening switch
 - 1, Open the load switch
 - 2, Take out the key of program lock
 - 3, Open the door
- Please keep the key of lock properly in case lost.
